# Production of slags from pig iron and steel manufacturing

	Metal production	Slag production	Specific production
	(kt)		(kg <sub>slag</sub> /t <sub>iron</sub> ) (kg <sub>slag</sub> /t <sub>steel</sub> )
<b>Pig iron manufacturing</b>	4 039	1 529	379
<b>Steel manufacturing</b>	4 974	658	Total 132 - furnace 115 - ladle 22

Data for the year 2013, ArcelorMittal Ostrava a.s. TŘINECKÉ ŽELEZÁRNY, a.s.  
VÍTKOVICE STEEL, a.s. VÍTKOVICE HEAVY MACHINERY a.s.

# Bonding ability of substances

## Binders

Substances connecting particles of other solid matter together

### Hydraulic binders

- There are created products, which firstly harden in the air, later harden and become solid both, in the air and water as well
- Hydraulic phases  $\beta$ - $C_2S$ ,  $C_3S$ ,  $C_3A$ ,  $C_{12}A_7$ ,  $C_2F$ ,  $C_4AF$ , less important is content of  $C_3MS_2$
- (C – CaO, S –  $SiO_2$ , A –  $Al_2O_3$ , F –  $Fe_2O_3$ , M – MgO, and  $C_2S$  is  $2CaO \cdot SiO_2$ )

### Latent hydraulic binders

- Hydraulicity manifests in effect of activator ( $Ca(OH)_2$ , water glass), water itself is insufficient for initiation of reactions
- $Al_2O_3$  and  $SiO_2$  have to be included in amorphous state, CaO helps to form hydraulic products

Slags can show both, hydraulic and latent hydraulic ability as well

# Requirements on slags

## Common hydraulicity

Presence of hydratable phases  $\beta$ -C<sub>2</sub>S, C<sub>3</sub>S, C<sub>3</sub>A

- determined by the presence of enough big amount of CaO

- slow cooling transformation  $\beta$ -C<sub>2</sub>S  $\rightarrow$   $\gamma$ -C<sub>2</sub>S  $\approx$  **10 %** volume change
  - $\rightarrow$  disintegration of slags
- hydration of free CaO and MgO
  - $\rightarrow$  disintegration of slags

Better suits **steel** slag

## Latent hydraulicity

Sufficient amount of glassy phase

- fast cooling down
- related to
  - $\rightarrow$  composition
  - $\rightarrow$  viscosity curve
  - $\rightarrow$  transition temperature

Blast furnace slag contains ca. 40 wt.% SiO<sub>2</sub>  
 $\rightarrow$  guaranteed vitrification

**Granulated blast furnace slag** (standard industrial product) suits to all requirements

# Typical slag composition

Slag	Composition (wt.%)				
	CaO	SiO <sub>2</sub>	Al <sub>2</sub> O <sub>3</sub>	MgO	FeO+Fe <sub>2</sub> O <sub>3</sub>
Blast furnace	35-38	40-45 <b>C:S≈1:1</b>	6-9	10-14	0,5-1
EAF	35-60	9-20	2-9	5-15	15-30 <b>15-30</b>
BOF	30-55	8-20 <b>C:S&gt;1</b>	1-6	5-15	<b>10-35</b>
Ladle	<b>30-60</b>	<b>2-35</b>	<b>5-35</b>	<b>1-10</b>	<b>0,1-15</b>

# Theoretical and real phase composition of ladle slags

Precondition  $\Sigma(\text{CaO}, \text{SiO}_2, \text{Al}_2\text{O}_3) = 100\%$

X-Ray phase diffraction

## The region of lower $\text{SiO}_2$ content

Balanced phase association

- $\text{C}_2\text{S} - \text{C}_3\text{A} - \text{C}_3\text{S}$
- $\text{C} - \text{C}_3\text{S} - \text{C}_3\text{A}$

$\gamma\text{-C}_2\text{S}$ ,  $\beta\text{-C}_2\text{S}$ ,  $\text{C}_{12}\text{A}_7$ , merwinite  $\text{C}_3\text{MS}_2$ ,  
 gehlenite  $\text{C}_2\text{AS}$ , anortite  $\text{CAS}_2$ ,  $\text{C}_3\text{S}$ ,   
 $\text{Ca}_2\text{AlMnO}_5$ ,  $\text{CaO}$ ,  $\text{Ca}_2\text{AlMnO}_5$

## The region of higher $\text{SiO}_2$ content

Balanced phase association

- $\text{C}_2\text{S} - \text{C}_3\text{A} - \text{C}_{12}\text{A}_7$
- $\text{C}_2\text{S} - \text{C}_2\text{AS} - \text{CA}$
- $\text{C}_2\text{S} - \text{C}_3\text{S} - \text{C}_3\text{A}$

$\gamma\text{-C}_2\text{S}$ ,  $\alpha'\text{-C}_2\text{S}$ ,  $\text{C}_{12}\text{A}_7$ , akermanite  $\text{C}_2\text{MS}_2$ ,  
 gehlenite  $\text{C}_2\text{AS}$ , anortite  $\text{CAS}_2$ ,  $\text{MgO}$ ,  
 $\text{MgO.FeO}$

# Real phase composition of slags

- BF slag
  - Aggregate – gehlenite, akermanite
  - Granulated – glassy phase
- Steel furnace slag
  - $\beta$ - $C_2S$ , FeO, brownmillerite, CaO
- Steel ladle slag
  - $\beta$ - $C_2S$ ,  $\gamma$ - $C_2S$ ,  $C_3S$ , MgO, merwinite, gehlenite, akermanite, brownmillerite

$\beta$ - $C_2S$ ,  $C_3S$  are hydraulic phases → possibility to use slags bonding ability

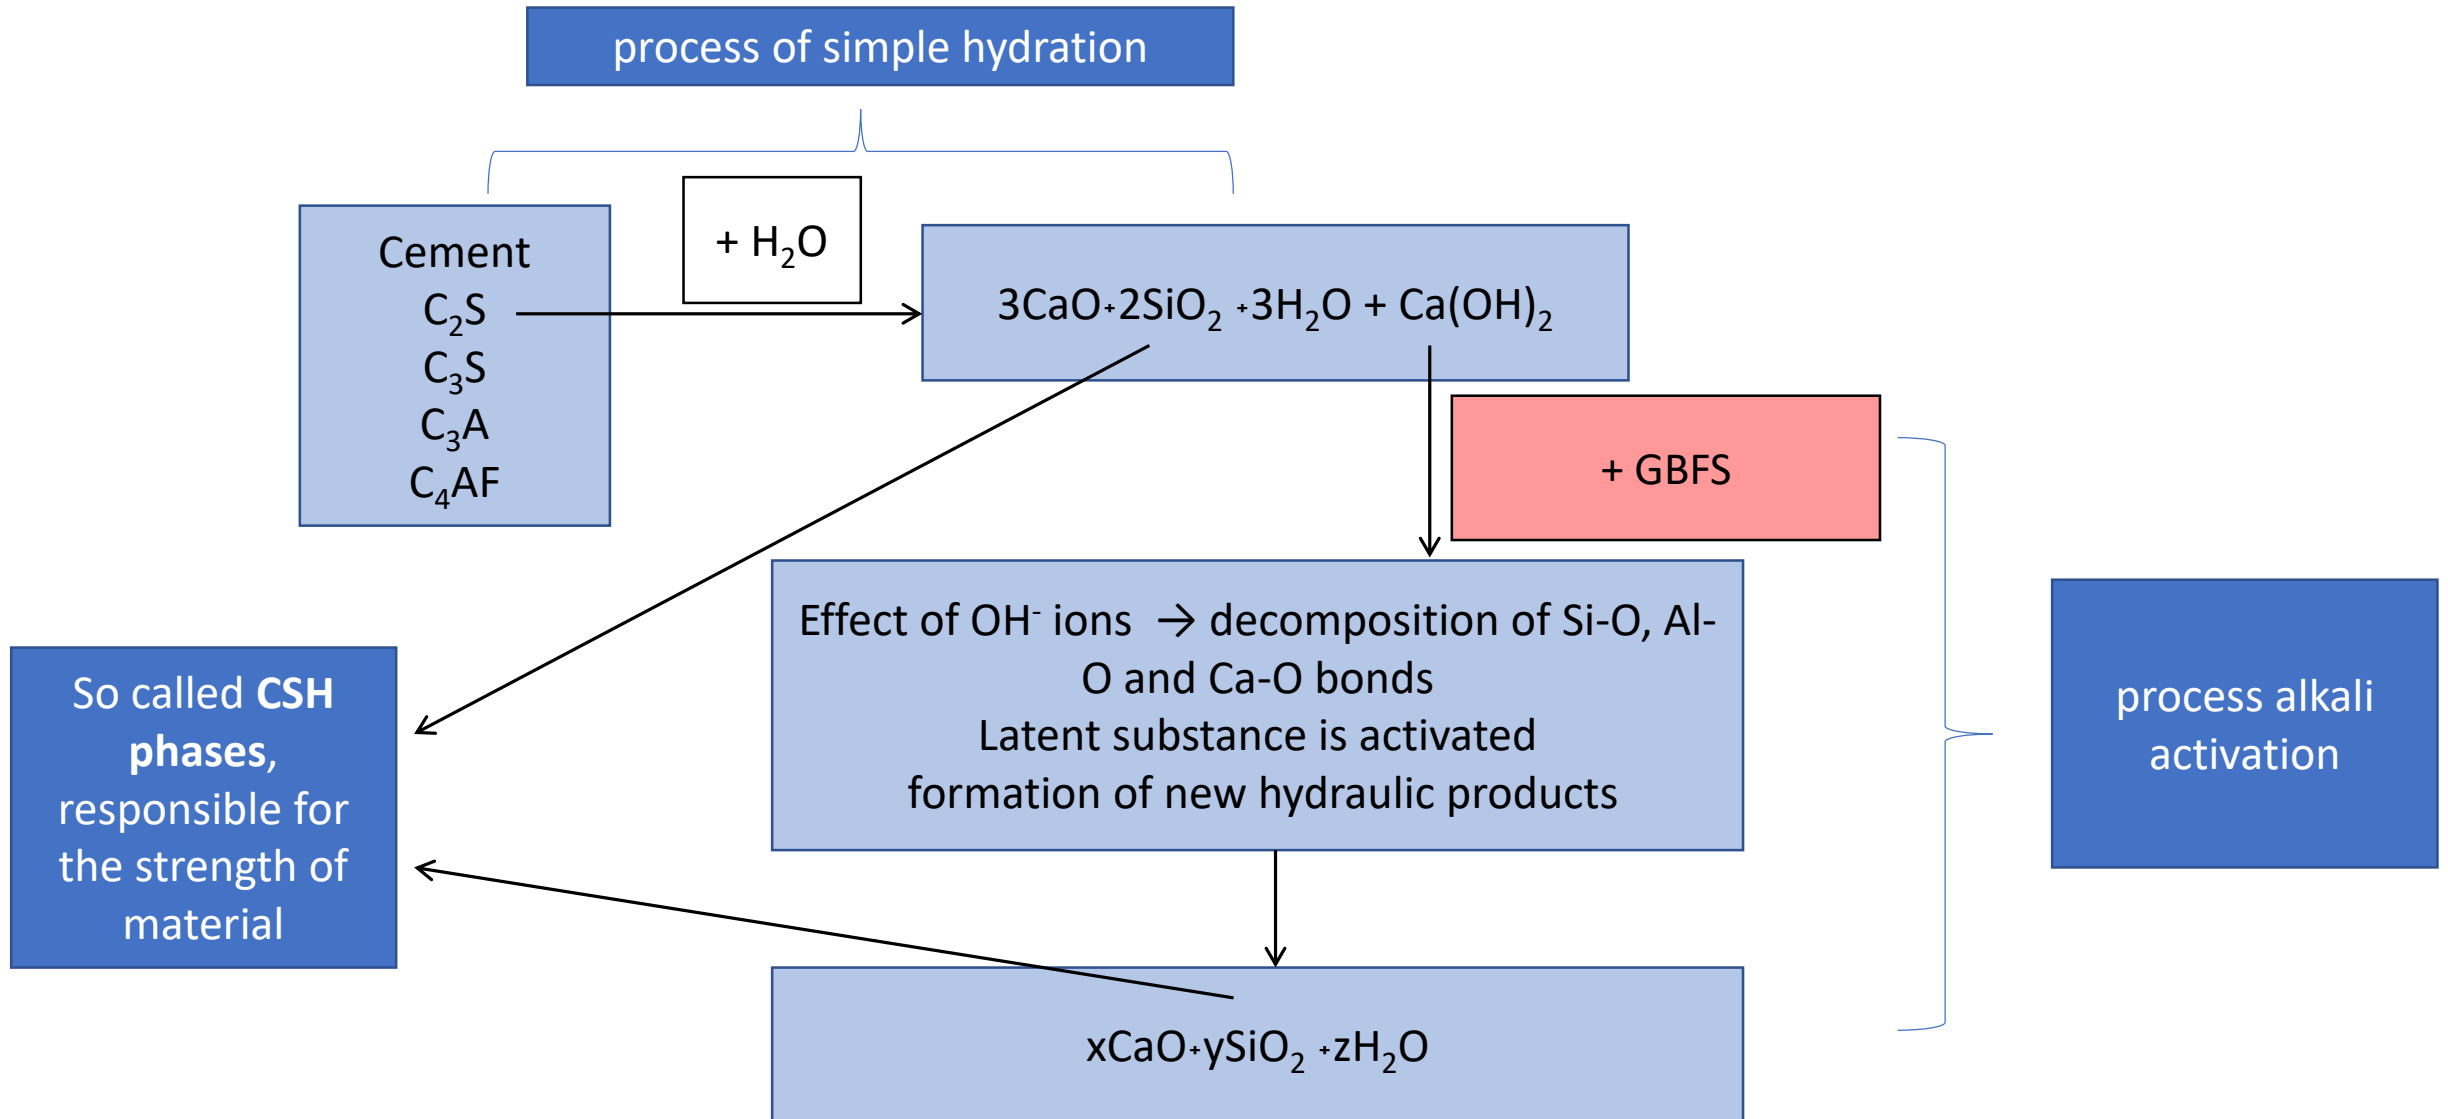

# Standard use of granulated BFS

Cement class	Cement name	Cement mark	Clinker	GBFS		Other main additional components
				(wt.%)		
II	Slag	II/A-S	80 – 94	6 – 20	-	
		II/B-S	65 - 79	21 – 35	-	
	Portland blended	II/A-M	80 - 94		6 – 20	
		II/B-B	65 - 79		21 – 35	
III	Blast furnace	III/A	35 – 64	36 – 65		
		III/B	20 – 34	66 – 80	-	
		III/C	5 - 19	81 -95	-	
V	Blended	V/A	40 – 64	18 – 30		18-30
		V/B	20 – 38	31 - 50		31-50

**Up to 95 %**

- Application of GBFS in common cement
  - Combination of alkali activation and common hydration

# Use of latent hydraulicity granulated blast furnace slag (GBFS)

- Slag has an amorphous character

- Treatment process

milling of GBFS

adding of agents

activation by water glass

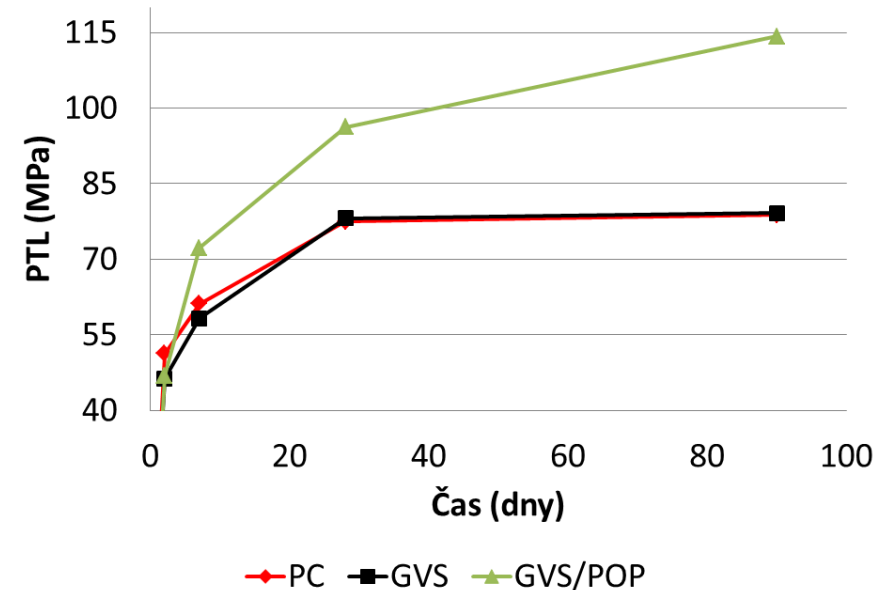

hydration in wet storage

## Products of hydration

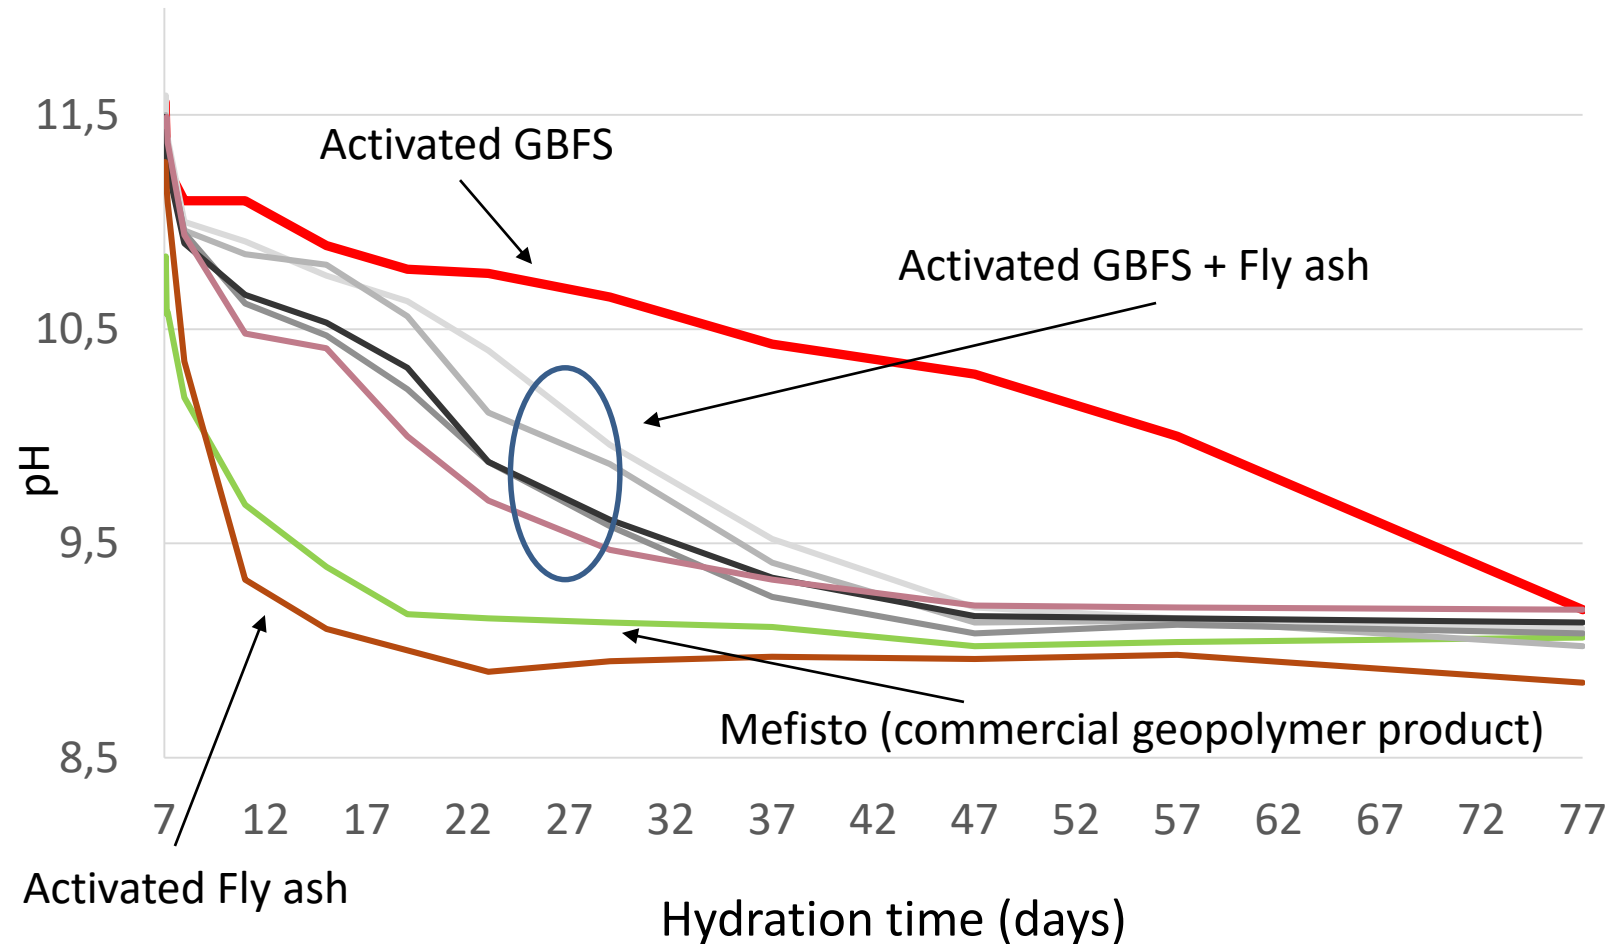

As a result of high CaO content the hydration products are similar to hydration products becoming from common cement

Addition of active  $Al_2O_3$  increases representation of products so called geopolymeric type

Sample	GBFS	Fly ash	CEM I 42,5
	(wt.%)		
GBFS	100	---	---
GBFS/FLY ASH	80	20	---
PC	---	---	100

# Indirect observation in progress of GBFS hydration

- Faster drop in pH → formation of geopolymeric products
- Slower drop in pH → formation of CSH phases
- Confirmed by NMR

# Study of hydraulic properties of steel slags

sample	sample character	28 days – water activation	28 days – water glass activation

<b>Average</b>		<b>5</b>	<b>40</b>

# Use of bonding ability of slags

- Treatment of grained (fine grained) materials to compact wholes

Strength of prepared briquettes  
up to 11 MPa, without content  
of conventional binder

# Examples of lightweight samples

Lightweight sample from activated GBFS+Fly ash; 3,8 MPa;  $722 \text{ kg}\cdot\text{m}^{-3}$ ; apparent porosity 72%

Lightweight sample from furnace slag; 3,3 MPa;  $930 \text{ kg}\cdot\text{m}^{-3}$ ; apparent porosity 60%

Lightweight sample from Ladle slag; 2,3 MPa;  $980 \text{ kg}\cdot\text{m}^{-3}$ ; apparent porosity 60%

**Thank You for attention.**
